

PGuard advance

PGuard advance is a central evaluation and management software for messages (status, event, error) from one or more Dallmeier recorders, decoders, streamers or MicroStreamers.

PGuard advance can be operated as a single-user solution in the server version. An extension to a multi-user solution in a LAN is always feasible with several PGuard advance clients. In this case server and clients access the server based MySQL database together and simultaneously. Thereby processing status and data are being actualised in real time.

The configuration of the total system can be conducted centrally, quickly and easily. All settings can be transferred to the clients after server configuration. Then the single client settings can be adopted individually (relevant recorders, message priority, triggered actions, etc.).

Advantages PGuard advance

- Operating system Windows XP
- Standalone or server/client installation
- Recommended for up to 10 clients
- Integrated MySQL database
- Recommended for up to 100000 messages
- Centrally, fast and simple configuration
- Individual and versatile client adjustment
- Recorder monitoring
- Client monitoring
- Licensing with DDS (Dallmeier Dongle Server)

Item numbers

- 200.031 (1x licence)
- 200.032 (2x licence)
- 200.033 (4x licence)
- 200.030 (PGuard Multiuser for central management of alarm messages from various work stations. One license is required per work station.)
