new product update

Access Control Technology design and manufacture an extensive range of electronic access control products and systems.

Continuous investment in research and development, in addition to a close working relationship with our customer base, results in high quality design and cost effective solutions.

ACTpro-x

ACT has developed a new range of *cost-effective* proximity readers which incorporates both ACT RFID and HID formats. This reader range facilitates both 'clock & data' and 'weigand' formats in one reader allowing ACT and HID cards and fobs to be read easily.

ACTPro-x readers are available in proximity only, and pin and proximity for additional security. The multi format Pro-x reader range also provides the flexibility to integrate with existing ACT access control systems.

Key Features

- ACT RFID cards and Fobs supported
- HID Cards and Fobs supported
- ACTpro-x1030 Vandal Resistant cover available
- Robust Polycarbonate housing
- Indoor or outdoor installation (IP67)

ACTWinPro Time and Attendance Module

The ACTWinPro Time and Attendance Module (TAM) records attendance and monitors absence, automating your time & attendance needs. It integrates simply and seamlessly with your access control requirements. It automatically calculates employee time and produces invaluable management reports, which may help control labour costs.

Key Features

- Attendance Tracking
- Holidays management
- Absence reporting
- Crystal Report generation
- EU Working Time Directive
- Export to payroll applications

ACTWinPro 2.4

ACTWin pro 2.4 is the new 'Windows VISTA' compatible version of the ACT software application. It provides enhanced reporting, support for global Anti-Passback, count areas, multiple user cards, validity times and extra user rights.

Global Anti-Passback support can be used to ensure users clock in for Time and Attendance and stop entry tail-gating. This system provides extra security at entry points and the functionality to monitor employees timekeeping.

Global Input/Output support allows an event on one controller to trigger the output or door on another controller. This is useful for large sites with multiple controllers, by reducing cabling needs, ensuring efficient networking installation time and cost savings.

The **Communications Service Module** ensures a simplified and speedy installation by eliminating the security setting or user privilege issues that often occur at installation.

Validity Times enables cards to be programmed with time periods for validity, and is fully managed by the ACTWinpro software. A variety of locations, for example sports clubs, need to grant, plan and co-ordinate short term access. The option can manage these needs, thus saving time for the system user and allowing efficient card re-use.

Multiple User Cards can be used with the ACT 3000, using a single database entry to manage proximity cards, mifare cards, magstrips, barcodes and long range transmitters. This optimises database entry time and management for the end user.

Enhanced Reports may now be exported from the report view. A System Status report is also available showing the number of offline doors, doors ajar, tampers etc.

Counting Areas feature is ideal for locations (eg. car parks) that need to manage user volumes. This helps end-users manage volumes at an optimum, while still adhering to health and safety levels.

Some of our New Product Developments for 2007

ACT Door Entry Over IP

The **ACT Door Entry Over IP** program allows the PC operator to view and speak to the caller, and open the door.

The **ACT Door Entry Over IP** system enables users to control access to their premises, by using the existing LAN and PCs. It eliminates the requirement for multiple handsets to be installed in the building, along with the associated wiring, provides convenience as users can remain at their PC to allow access.

Key Features

- Integrates with LAN
- 15 frames per second
- D1(720x480) images
- Operates in Day/Night
- Log event view
- Images directed to different PCs
- 10 PCs supported

ACT10 Audio/Video

The ACT10 Audio/Video product range, combines the simple keypad access for regular user with audio/video door entry for visitors, in an attractive vandal resistant housing.

Key Features

- 10 User codes
- Vandal resistant
- Available as Audio only or Audio and Video
- Attractive, highly durable ABS plastic telephone
- 2 User groups, interlock, door monitoring
- 2 relays
- Backlit keypad
- Tamper protection

ACTWinPro 2.5

DVR Integration

The ACTWinPro 2.5 release will feature DVR Integration. This links the access control and CCTV systems over a TCP/IP network. This integration allows for the time stamping of CCTV footage and the instant recall of specific footage. Thus, not only will one software application manage both your CCTV and Access control systems, but time stamped footage can be linked to access events. This will save time for security managers and provides visual verification records.

Alarm Management

ACTWinPro 2.5 will notify individuals by email or SMS of an alarm occurrence with the option to send instructions on how to manage the alarm. For example, if a fuse blows on a PSU, you may want to send an email to the facilities manager with the event in the log. Alternatively, instructions may come up on the PC with the contact details of the installer. If a door gets forced, an email may be sent to the security guard and an SMS text message sent to the company manager. This can be used for real time business continuity management, automatically pinpointing key people regardless of their location.
