

Secure retirement living

» Focussing on residents «

People feel at home where they feel good and are familiar with the surroundings. The retirement village, in the centre of Windisch, in a park-like environment, is an ideal place to be for people in their third and fourth stages of life. The facility provides different types of living, support and care, plenty of variety and numerous opportunities to take part in group activities. Elderly residents with different residential options including care and support call Sanavita Alterszentrum Lindenpark their home. A pleasant and appealing atmosphere within and around the development is paramount – it goes without saying that security is also in the focus. In terms of locking systems owners opted for a combination of mechanical and electronic locking system: EVVA ICS and Xesar.

Xesar: guaranteed healthcare

Particularly healthcare facilities are highly sensitive areas that not everyone should have access to. A highly secure, yet flexible locking system is required to ensure access restrictions and simultaneously grant medical staff fast access to individual areas. You can flexibly grant and revoke access authorisations. As a result, exclusively authorised users are granted access. Consequently, the existing locking system at Alterszentrum Lindenpark was replaced by Xesar. The electronic solution now also secures medical cabinets including drawers containing toxic substances as well as refrigerated medical cabinets at the corresponding ward facilities. The Xesar wall reader as the updater unit at the main entrance guarantees fast security within the existing virtual network. Xesar wall readers in combination with electronic motorised cylinders (EMZY) have been installed in all outside doors. The project was managed

by EVVA Rotkreuz and local EVVA Partner UTO Sicherheitstechnik AG took care of system installation.

Xesar and ICS combined as required

“Securing the building towards the outside and securing residents’ properties was the primary aim”, Remo Breuss explains, EVVA head of sales in Switzerland. “Exclusively authorised persons must have access to medical areas. Xesar can record a precise protocol showing who has access to what and when. The ICS mechanical locking system has also been integrated. The vast number of different user groups was a particular challenge. The project also required plenty of expertise to comply with the requirements for an escape route concept as per statutory stipulations. The combination of electronic and mechanical locking system was the ideal solution for Alterszentrum Lindenpark.

EVVA technology in the facility

- › 502 ICS cylinders
- › 415 Xesar combi keys
- › 21 e-half cylinders
- › 56 e-escutcheons
- › 162 e-handles
- › 14 wall readers
- › 1 updater unit
