

## VIVOTEK enhances user interface and functionalities with VAST 2 video management software

Published on 24 Jul 2017

VIVOTEK, the global IP surveillance solution provider, unveiled the latest release of its video management software, VAST 2. Building on the underlying powerful software engine of VAST, VAST 2 reveals a brand new intuitive user interface and boasts an extended range of user-centred functionalities, including auto setup, advanced search, and custom layout as well as additional add-on functions for failover protection, transportation, and transaction solutions. The new VAST 2 is designed for efficient video management, allowing security operators to reduce both operational and maintenance costs.

*“VIVOTEK has run through a series of alpha and beta tests before the launch of VAST 2. We have collected feedbacks from our customers and improved significantly both the usability and functionality to make VAST 2 an even better experience for our users. For VAST 2, we designed a problem feedback mechanism, allowing the system to detect problems automatically and enabling*

*security operators to send feedback manually via a popup window. This feedback will be delivered directly to VIVOTEK's Field Application Engineer team and accelerate our customer service,"* says Perkins Chen, Director, Research and Develop Division 2, VIVOTEK Inc.

## **VAST 2 benefits:**

**Easy to Use:** Utilising automatic configuration wizards, VAST 2 makes it simple to set up surveillance systems. Users can adjust layout by simply dragging a corner of the window, a feature which also supports VIVOTEK fisheye dewarp. With the addition of the evidence-lock function, it is now even easier to manage numerous investigation scenarios by manually extending the retention time of recorded videos. These videos are easily exported with custom layouts and a quick snapshot function is also available to instantly preserve this critical evidence.

**Efficient Search:** VAST 2 offers two types of search, smart search and thumbnail search. Both are designed to help security operators quickly filter scenarios from any suspicious scene. With smart search, users can select the specific region of interest and the system will show an array of thumbnails representing footage in which motion was detected. In addition to the thumbnail search, the feature allows the user to browse thumbnails based on time frame. Security operators can narrow down any investigation by rapidly identifying the clips of interest.

**Extensive add-ons:** VAST 2 also supports additional functionality in advanced features by licensing. It is equipped with failover protection, a system which transfers video recording to secondary sites in the event of any system outage, network error, or other malfunction and ensures that video recordings are never interrupted. Recognising the growing needs of vertical markets, VAST 2 demonstrates the strengths of fast integration to customise specific functions. In the transportation field, VAST 2 can track and display vehicles' real-time location from GPS receivers and playback videos with recorded paths. Finally, VAST 2 supports retail markets by showing any transaction on both live and

playback video, and allowing users to search transactions by entering different criteria.
